

Canadian Metaresearch Data Challenge

This is the submission for the [Canadian Metaresearch Data Challenge](#), part of the 2nd Canadian Open Science Conference (University of Ottawa, October 27–29, 2026). The call asks for a methodology to construct an open, reproducible, and inclusive dataset capturing the Canadian metaresearch landscape. Selected teams receive up to CAD \$4,000 to implement the proposed methodology and present findings at the conference.

The [proposal](#) is a directory of Canadian metaresearchers, structured around people, the institutions they're affiliated with, and the initiatives they contribute to — built to highlight the field's actual diversity. The database is built up from a variety of scholarly and para-scholarly resources, including scientific papers, scholarly metadata, social media profiles, and content scraped from faculty webpages. Records are organized using established typologies and self-described tags.

The [data model](#) page lays out how the directory is structured: one JSON record per person, institution, and initiative, cross-referenced by ID. The [pipeline](#) page traces how the four sources actually flow into those files. The [data sources](#) page describes each source and tool used in the pipeline — Google Scholar, OpenAlex, Publish or Perish, Crossref, ORCID — on its own terms. The [rendering](#) page shows the processes involved in visually representing the information and producing data that can be fed into analytical protocols.

The [work plan detail](#) page gives the full phase-by-phase breakdown behind the proposal's compressed timeline paragraph.

The entire project is in the public domain under a CC0 license. The text and code can be reviewed at github.com/zackbatist/CMDC.

Outcomes and implications. What can this dataset do?
